

Disposable Surgical Gowns

AVANTEB

Disposable surgical gowns and drapes has been the preferred medical textile in many developed countries for a long period of time. The European committee for standardisation (CEN) has published the EN 13795 in September 2004, by the publishing of the mentioned norm, a lot has become standardisation in surgical environments where the main purpose is wellbeing of patient and surgical team by avoiding any reciprocal infection.

This puts lots of pressure on the shoulders of the purchasing departments of the hospitals and healthcare companies. In the medical sector it is very simple to find these disposable materials at different price range, but it is important to know where to buy.

It is statistically proven that in the long run single use medical textile cost a lot less than reusable fabrics. You do not have to worry about the time and energy spent on reconditioning these fabrics for the next use, also one needs to consider that the reconditioning material is not going to perform as good after first use: therefore, the barrier protection, microbial penetration, absorbency or repellence are going to be a lot less than required. All single use products come with extensive quality assurance programs that include inspection and barrier test results throughout process control, sterility assurance standard.

Disposable products are also given lot numbers that allows tracking, with help of these measures' consistency of performance and a high level of confidence are easily assured.

It can easily be claimed that disposable medical textile is replacing the old-style cotton polyester. Considering the fact that these fabrics are safer to use because of sterilisation and traceability plus the cost efficiency in the long run. This is why disposable should be choice in medical textile industry.
